

IN THE CLAIMS:

Claim 1. (Currently amended): A method of manufacturing wafer level semiconductor device, comprising the steps of:

sealing the front surface of a semiconductor wafer having the front and rear surfaces and having formed a plurality of semiconductor chips on the front surface with resin material;

a first marking the position information corresponding to each chip in the region of each chip at the rear surface of said semiconductor wafer;

conducting electrical test to each chip;

a second marking the result of said electrical test corresponding to each chip in the region of each chip at the rear surface of said semiconductor wafer; and

dicing the semiconductor wafer into each chip.

Claim 2. (Currently amended): A method of manufacturing wafer level semiconductor device comprising:

sealing the front surface of a semiconductor wafer having the front and rear surfaces and having formed a plurality of semiconductor chips on the front surface thereof with resin material;

conducting electrical test to each chip;

marking in the region of each chip at the rear surface of said semiconductor wafer, the position information corresponding to each chip and the result of said electrical test; and
dicing the semiconductor wafer into each chip.

Claim 3. (Currently amended): A method of manufacturing wafer level semiconductor as claimed in claim 1 or 2, wherein the circuit surface of said semiconductor wafer and the opposite surface thereof are sealed with resin material and said position information and result of electrical test are marked in the region of each chip on the surface.

Claim 4. (Currently amended): A method of manufacturing wafer level semiconductor device comprising:

sealing the front surface of a semiconductor wafer having the front and rear surfaces and having formed a plurality of semiconductor chips on the front surface thereof with resin material;

attaching a resin sheet on which marking is made on said semiconductor wafer, to said rear surface of said semiconductor wafer to indicate position of each chip; and

dicing the semiconductor wafer into each chip.

Claim 5. (Currently amended): A method of manufacturing wafer level semiconductor device as claimed in claim 4 further comprising:
conducting electrical test to each chip; and
marking the result of said electrical test corresponding to each chip to the region of each chip of the rear surface of said semiconductor wafer.

Claim 6. (Withdrawn): A semiconductor device comprising:
a semiconductor chip diced from the predetermined position of wafer wherein circuits are formed on the front surface,
a resin sealing the front surface of said semiconductor chip;
an external output terminal exposed from said resin and connected with said circuits; and
a marking provided at the rear surface of said semiconductor chip to indicate the predetermined position of said wafer.

Claim 7. (Withdrawn): A semiconductor device comprising:
a semiconductor chip diced from the predetermined position of a wafer where circuits are formed on the front surface;
a resin sealing the front surface of said semiconductor chip;
an external output terminal exposed from said resin and connected with said circuit;
a resin sheet attached to the rear surface of said semiconductor chip; and

Serial No.: 09/686,958
OA dated September 3, 2003
Amdt. dated December 3, 2003

a marking indicating the predetermined position of said wafer printed on said resin
sheet.
